

## DS Capstone Project Data Wrangling Steps:

1. Loaded the relevant libraries and set the working directory
2. Loaded the csv files
3. Observed the data
4. Converted raw csv files into dataframes
5. Viewed the dataframes columns to consider plan of action
6. Removed useless columns such as 'unamed'
7. Renamed columns for capitalization and naming convention
8. Repositioned the columns into relevant positions
9. Proceeded to do the same of the other dataframe
10. Performed a left join based of 'brewery id'
11. Removed the id columns as they were no longer necessary
12. The column 'IBU' was the biggest consideration for missing variables. Over half the rows were NaN so decided to omit the column for use.
